

JARVIS MARK-I - DAY 3

Automation & App Control System

Day 3 Goal

Day 3 focused on making Jarvis useful in real-world tasks. Instead of only listening and speaking, Jarvis now performs actions on the computer such as opening applications, searching Google, and playing YouTube videos.

Features Added

- Open Applications
- Google Search Automation
- YouTube Search & Play
- Dynamic Command Handling
- App Control using Python
- Voice Feedback after Actions

Modules Used

subprocess - Launches external applications from Python.

pywhatkit - Provides automation functions such as Google Search and YouTube playback.

speech_recognition - Converts speech into text.

edge_tts - Generates realistic AI voice responses.

pygame - Plays generated audio files.

asyncio - Handles asynchronous execution.

Key Concepts Learned

1. Automation
2. Dynamic Commands
3. String Manipulation
4. Application Launching
5. Browser Automation
6. Command Processing
7. Real-world Assistant Design

Static vs Dynamic Commands

```
if "youtube" in command:
    open youtube
elif "search" in command:
    search_query = command.replace("search", "")
    pywhatkit.search(search_query)
```

Workflow

Architecture Upgrade

Day 1: Text → Voice

Day 2: Voice → Text → Voice

Day 3: Voice → Text → Decision → Action → Voice

Day 3 Achievement

By the end of Day 3, Jarvis became an automation assistant. It can understand voice commands and perform real actions on the computer. This is the first version of a practical desktop AI assistant.
